

Senior Web Application Developer

Position Summary

We are seeking an experienced, senior-level web developer to work with a small team, further developing an existing web-based software system. We require a motivated self-starter capable of working independently or in a small group, on individual tasks and larger projects, with minimal supervision. You must have the ability to effectively communicate with peers and management throughout the development process. Flexibility and broader competence in project management and maintaining production systems is ideal, though not required.

We are a provider of mortgage lending technology. Our software provides an online solution to manage data, workflow and documentation through the mortgage banking process, from origination through loan sale. We are closely affiliated with a mortgage bank based in Dallas, Texas.

The Senior Web Application Developer will be reporting to a single Development Manager and, in addition to program design and coding, will be required to provide leadership in formulating project plans and objectives, understanding architectural considerations, and working with support staff and client users to ensure that the application meets business requirements. Because much of the work will be performed within the scope of the existing software, there will be time spent in understanding the existing system, along with business concepts and requirements.

Technical Requirements

- Strong ASP.NET web development skills with experience designing scalable, web-based applications
- C# .NET
- Solid programming foundation in SQL Server 2008 including database design, SQL, and stored procedure development
- Strong background in object oriented design and implementation
- Experience with Ajax, Javascript, HTML, CSS, XSLT, XML
- Solid knowledge of site security and application performance tuning
- Experience with OCR and PDF image manipulation is a plus

General Skills

- Ability to work independently or in a small group with minimal supervision
- Effective in both coding and architectural design
- Broad General IT knowledge (applications development, testing, deployment, operations, security, administration, DBMS, etc.)
- Experience leading projects and understanding the software business is a plus

- Be able to communicate clearly, effectively, and organized
- Outstanding written, verbal, and diagrammatic communication skills

General

- Create time and resource estimations and milestones
- Assist in system architecture and coding
- Develop functional prototypes to demonstrate proof of concepts
- Work closely with support staff in debugging and problem resolution
- Work with product management to define feature sets and time estimations/costs
- Interface with non-technical company staff at all levels effectively
- Prepare written reports of functions
- Perform other duties as required
- Must reside in the Dallas /Ft. Worth Metroplex area
